

## Global Energy Trading

Winston Churchill once noted that “Safety and certainty in oil lie in variety and variety alone.” A century later, the same holds true for renewables.

Global electricity trading offers significant cost savings. As with fossil fuels, power that is generated from unevenly located renewable sources can be traded to ensure a diverse, steady, and reliable supply at lower costs.

Further, cross-border trading reduces the need for expensive and often environmentally damaging backup power plants. Finally, cross border power trading reduces financial risks by ensuring that excess power generated during favorable conditions can be sold to neighboring countries.
